COMPUTATIONAL MODELING OF DRUG DISPOSITION
 Evans Coutinho
 E-mail: evanscoutinho@gmail.com

4. CURRENT CHALLENGES AND FUTURE DIRECTIONS

- Data quality is the most limiting factor in modeling drug disposition.
- The major recent advancement is in elucidating the role and successful modeling of various transporters (some of which was discussed).
- Some commercial programs have implemented modeling active transport such as the recent versions of GastroPlus (Simulations Plus, CA), PK-Sim (Bayer Technology Services, Germany) and ADME/Tox WEB (Pharma Algorithms, Canada).
- The currently available transporter models cover a small fraction of all transporters involved in drug disposition, efforts are still needed to investigate other transporters such as MRP, BCRP, NTCIP, and OAT, to get a more complete understanding of the drug pharmacokinetic profile.
- One commercial firm - Algorithm Builder (Pharma Algorithms, Toronto, ON, Canada) offers customers to generate their in-house models with their own training set and the statistical algorithm of their choice.

QSAR model

$$\ln(VD) = 0.688 (\pm 0.17) MR - 0.11 (\pm 0.07) \pi + 2.322 (\pm 0.31)$$

■ n = 12, r = 0.941, s = 0.314, F = 77.16

Handwritten notes: 5.6 , 3.6 , 0.37 , $t_{1/2} \Rightarrow$ dosing of agent

2. DRUG DISTRIBUTION

- The structural and physicochemical properties of a drug determine the extent of its distribution, as seen by
 - volume of distribution (V_d),
 - plasma-protein binding (PPB), and
 - blood-brain barrier (BBB) permeability.
- Recall V_d and its relation to half life $t_{1/2}$.
- V_d is a measure of partitioning of drug between plasma and tissue, an important proportional constant that, when combined with drug clearance, could be used to predict drug half-life. The half-life determines dosing.
- Computational models of predicting V_d based on computed descriptors is difficult.
- However, Lombardo et al have proposed an approach to predict V_d for neutral and basic compounds with two in vitro physicochemical parameters
- $\log t_{1/2} = 0.0080 (\pm 0.0747) - 0.2294 (\pm 0.0410) E_{logD} - 0.9311 (\pm 0.0777) t_{1/2A} + 0.8885 (\pm 0.0956) \log t_c$
